

ABSTRACT

[0022] A universal connection kit for installing a bath spout having an internal coupling at the discharge end to a wall pipe. The connection kit is made up of a conduit and a number of adapters for connection to varying types of wall pipe. The components are connected together via corresponding threaded sections. The particular adapter used depends upon the type of wall pipe present since each adapter allows connection to one of the common types of wall pipe. The universal connection kit provides a flush fit of the bath spout against the wall, regardless of which adapter is used, if any.
